Problem Statement: PARIVESH 3.0 – Next-Gen Role-Based Workflow System

1. Introduction

The current process of environmental clearance involves multiple stakeholders, complex documentation, and manual meeting preparations. To improve transparency, efficiency, and speed, we are launching the **PARIVESH 3.0** initiative. This hackathon challenge tasks participants with building a robust, role-based application management and meeting documentation portal.

2. The Challenge

Participants must develop a unified web portal that facilitates the end-to-end lifecycle of an environmental clearance application—from initial filing by a proponent to the final publication of the Minutes of the Meeting (MoM).

3. Core User Roles & Access Control

The system must implement a strict Role-Based Access Control (RBAC) mechanism managed by a central Administrator.

A. Admin (System Controller)

- **Access:** Separate, secure login portal.
- **Key Responsibilities:** * Dynamic role assignment (Scrutiny Team vs. MoM Team).
    - Provisioning master templates for "Gist" documents based on application categories (A, B1, B2).
    - Managing sector-specific parameters (Mining, Infrastructure, etc.).

B. Project Proponent (PP) / Recognized Qualified Professional (RQP)

- **Access:** External portal for applicants.
- **Key Features:**
  - **Registration:** User onboarding with profile management.
  - **Categorization:** Selection of Application Category & Industry Sector.
  - **Application Filing:** Multi-step digital form for project details.
  - **Document Engine:** Secure attachment of mandatory technical documents.
  - **Fee Payment:** Integration of modern payment methods including **QR Code and UPI**.

C. Scrutiny Team (Verification Unit)

- **Access:** Internal review dashboard.
- **Key Features:**
  - **Verification:** Reviewing documents and verifying fee submission status.
  - **EDS (Essential Document Sought):** Ability to flag deficiencies and return the application to the PP/RQP portal for correction.
  - **Meeting Referral:** Refer verified applications for scheduled meetings.
  - **Auto-Gist Generation:** Trigger the automatic creation of a "Meeting Gist" by extracting data from the PP's application into the Admin’s master template.

D. MoM Team (Secretariat)

- **Access:** Meeting management dashboard.
- **Key Features:**
  - **Gist Editing:** Refining the auto-generated gist based on actual meeting discussions.
  - **Conversion:** Transforming the edited Gist into a formal "Minute of Meeting" (MoM).
  - **Security:** Locking and finalizing the MoM to prevent further edits after publication.

4. Technical Requirements

- **UI/UX:** The portal must have a clean, modern, and professional interface (Reference: Corporate Blue/White palette).
- **Document Output:** The system must generate documents (Gists/MoMs) in both **Microsoft Word (.docx)** and **PDF** formats.
- **Workflow Integrity:** Applications must flow linearly through statuses: *Draft -> Submitted -> Under Scrutiny -> EDS (if any) -> Referred -> MoM Generated -> Finalized*.
- **Security:** Ensure data isolation so a PP cannot see another PP's data, and MoM teams cannot alter Scrutiny-level checklists.

5. Evaluation Criteria

1. **Workflow Completeness:** Does the application move successfully through all four roles?
2. **UI Quality:** Is the interface intuitive and responsive?
3. **Automation Logic:** How efficiently is the "Gist" generated using the Admin's templates?
4. **Payment Integration:** Functional simulation of UPI/QR payment verification.
5. **Role Security:** Effective implementation of role-based permissions.

6. Deliverables

- A functional web application prototype. **(CMS Based – Content Management System)**
- Source code repository.
